a world of possibilities
to **adapt** to any existing network

Ethernet

Bartech's **proven** and **reliable** Ethernet interface provides hoteliers with an easy **"plug-and-play"** solution for room to server connection. Just an RJ45 socket compatible with the 10 Base Ethernet specifications is all that's required on the hotel's side.

Twisted Pair

An important quantity of **existing Bartech installations** are running through twisted telephonic pair using our **proprietary scanning units** and transmission cards. This largely used solution is ideal for existing hotels that cannot afford to change their cabling network.

Coax Cable

As an alternative to the above solution, communication between our automatic minibars and the Bartech server can also be monitored through a hotel's **existing MATV coax antenna**. Our system can work under **three different frequencies** thus being compliant with most existing PAY TV systems.

Wifi

Bartech has **successfully** completed several installations of **fully automatic minibars** within a Wi-Fi environment. Our Bartech system is **compatible** with any 802.11b compliant access point.

Zig Bee

We have added Zig Bee to our already existing range of connection capabilities. Intended for low data rate and **low power consumption** products, this technology ideally suits Bartech
